

1700V and 2500V XPT™ IGBTs

For high-voltage, high-speed power conversion applications

May 2017

DESCRIPTION

IXYS Corporation (NASDAQ: IXYS), a manufacturer of power semiconductors and integrated circuits for energy efficiency, power management, and motor control applications, has released 1700V and 2500V XPT™ (eXtreme-light Punch Through) IGBTs. With current ratings ranging from 29A to 178A, they are well-suited for high-voltage, high-speed power conversion applications. Devices co-packed with anti-parallel fast diodes are also available.

Designed using the proprietary thin-wafer XPT™ technology and the state-of-the-art IGBT process, these new devices display such qualities as reduced thermal resistance, low tail current, low energy loss, and high-speed switching capability. Also, thanks to the positive temperature coefficient of their on-state voltage, the new high-voltage IGBTs can be used in parallel, which provides cost-effective solutions compared to series-connected, lower-voltage device ones. This consequently results in reduction in the associated gate drive circuitry, simplicity in design, and improvement in the reliability of the overall system.

The optional co-packed fast recovery diodes have low reverse recovery time and are optimized to produce smooth switching waveforms and significantly lower electro-magnetic interference (EMI).

There are a number of high-voltage, high-speed power switching applications that can benefit from utilizing these discrete IGBTs. Among them are pulser circuits, laser and X-ray generators, high-voltage power supplies, high-voltage test equipment, capacitor discharge circuits, and AC switches.

The new XPT™ IGBTs are available in the following international standard size packages: SOT-227, TO-247, PLUS247, ISOPLUS i5-Pak™, TO-247HV, TO-247PLUS-HV and TO-268HV. The latter three have increased creepage distances between leads, making them robust against higher voltages. Some example part numbers include IXYH24N170C, IXYN30N170CV1, IXYH30N170C, and IXYH25N250CHV, with collector current ratings of 58A, 88A, 108A, and 95A, respectively.

Application Examples

Figure 1: Pulse circuit

Figure 2 and Figure 3 demonstrate two possible configurations of AC switches. The 2500V XPT™ IGBT **IXYX25N250CV1HV** in the high-voltage TO-247PLUS-HV package can be utilized to realize the switches. Both circuits can control the current precisely and also provide an overcurrent protection function. Figure 2 is a cost effective option.

Figure 2: AC switch

Figure 3: Bi-directional AC Switch

Figure 4: High-voltage trigger circuit for laser generation

Figure 1 illustrates a generic pulse circuit in which two 1700V XPT™ IGBTs **IXYH24N170CV1** (S1, S2) are used in parallel to control the power delivered to the pulsed load. The DC power supply charges the capacitor bank, and the stored energy is switched to the load.

Figure 4 is an example of a high-voltage trigger circuit used in flash-lamp pumped solid-state laser generation. When the 2500V XPT™ IGBT **IXYL40N250CV1** (Q1) is off, the capacitor C is charged through the resistor R and the transformer primary. When the capacitor is fully charged, Q is turned ON and quickly discharges C, which generates a pulse across the primary side; it is then stepped up across the secondary winding, producing a desired high-voltage pulse.
