

Features

- AEC Q100 Qualified
- 9A Peak Source/Sink Drive Current
- Wide Operating Voltage Range: 4.5V to 35V
- AEC Q100 Grade 1 -40°C to +125°C Operating Temperature Range
- Logic Input Withstands Negative Swing of up to 5V
- Matched Rise and Fall Times
- Low Propagation Delay Time
- Low, 10µA Supply Current
- Low Output Impedance

Applications

- Automotive DC/DC Regulators
- Electronic Power Steering
- Electric Vehicle Power Train Drives
- Brushless DC Motors

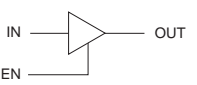

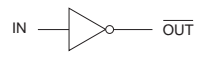

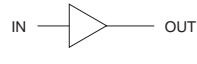

Description

The IXD_609SI is an automotive grade, high-speed gate driver that is qualified according to AEC Q100 standards. The IXD_609SI output can source and sink 9A of peak current, while producing rise and fall times of less than 45ns. Both the output and input are rated to 35V. The input is virtually immune to latch-up, and proprietary circuitry eliminates cross conduction and "shoot-through." The IXD_609SI has a Grade 1, -40°C to +125°C ambient operating temperature range.

The IXDD609SI is configured as a non-inverting driver with an enable, the IXDN609SI is configured as a non-inverting driver, and the IXDI609SI is configured as an inverting driver. The AEC Q100 qualified IXD_609SI is available in an 8-pin Power SOIC package with an exposed metal back.

1 Specifications

1.1 Pin Configurations

1.2 Pin Definitions

Pin Name	Description
IN	Logic Input
EN	Output Enable - Drive pin low to disable output, and force output to a high impedance state
OUT	Output - Sources or sinks current to turn-on or turn-off a discrete MOSFET or IGBT
$\overline{\text{OUT}}$	Inverted Output - Sources or sinks current to turn-on or turn-off a discrete MOSFET or IGBT
V _{CC}	Supply Voltage - Provides power to the device
GND	Ground - Common ground reference for the device
NC	Not connected

1.3 Absolute Maximum Ratings

Parameter	Symbol	Minimum	Maximum	Units
Supply Voltage	V _{CC}	-0.3	40	V
Input Voltage	V _{IN} , V _{EN}	-5	V _{CC} +0.3	V
Output Current	I _{OUT}	-	±9	A
Junction Temperature	T _J	-55	+150	°C
Storage Temperature	T _{STG}	-65	+150	°C

Unless stated otherwise, absolute maximum electrical ratings are at 25°C

Absolute maximum ratings are stress ratings. Stresses in excess of these ratings can cause permanent damage to the device. Functional operation of the device at conditions beyond those indicated in the operational sections of this data sheet is not implied.

5 Manufacturing Information

5.1 Moisture Sensitivity

All plastic encapsulated semiconductor packages are susceptible to moisture ingress. IXYS Integrated Circuits Division classifies its plastic encapsulated devices for moisture sensitivity according to the latest version of the joint industry standard, **IPC/JEDEC J-STD-020**, in force at the time of product evaluation.

We test all of our products to the maximum conditions set forth in the standard, and guarantee proper operation of our devices when handled according to the limitations and information in that standard as well as to any limitations set forth in the information or standards referenced below.

Failure to adhere to the warnings or limitations as established by the listed specifications could result in reduced product performance, reduction of operable life, and/or reduction of overall reliability.

This product carries a **Moisture Sensitivity Level (MSL)** classification as shown below, and should be handled according to the requirements of the latest version of the joint industry standard **IPC/JEDEC J-STD-033**.

Device	Moisture Sensitivity Level (MSL) Classification
IXD_609SI	MSL 1

5.2 ESD Sensitivity

This product is **ESD Sensitive**, and should be handled according to the industry standard **JESD-625**.

5.3 Soldering Profile

Provided in the table below is the Classification Temperature (T_C) of this product and the maximum dwell time the body temperature of this device may be ($T_C - 5$)°C or greater. The classification temperature sets the Maximum Body Temperature allowed for this device during lead-free reflow processes. For through-hole devices, and any other processes, the guidelines of J-STD-020 must be observed.

Device	Classification Temperature (T_C)	Dwell Time (t_p)	Max Reflow Cycles
IXD_609SI	260°C	30 seconds	3

5.4 Board Wash

IXYS Integrated Circuits Division recommends the use of no-clean flux formulations. Board washing to reduce or remove flux residue following the solder reflow process is acceptable provided proper precautions are taken to prevent damage to the device. These precautions include but are not limited to: using a low pressure wash and providing a follow up bake cycle sufficient to remove any moisture trapped within the device due to the washing process. Due to the variability of the wash parameters used to clean the board, determination of the bake temperature and duration necessary to remove the moisture trapped within the package is the responsibility of the user (assembler). Cleaning or drying methods that employ ultrasonic energy may damage the device and should not be used. Additionally, the device must not be exposed to flux or solvents that are Chlorine- or Fluorine-based. Mechanical dimensions.

5.4.1 SI Package (8-Pin Power SOIC with Exposed Metal Back)

- Notes:
1. Controlling dimension: millimeters.
 2. All dimensions are in mm (inches).
 3. This package conforms to JEDEC Standard MS-012, variation BA, Rev. F.
 4. Δ Dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15mm per end.
 5. Δ Dimension does not include interlead flash or protrusion. Interlead flash or protrusion shall not exceed 0.25mm per side.
 6. The exposed metal pad on the back of the package should be connected to GND. It is not suitable for carrying current.
 7. Lead thickness includes plating.
