## 16 Amp High Temperature Alternistor Triacs

### Description

This 16A Alternistor TRIAC solid state switch series is designed for AC power control applications such as hear control, motor speed control, lighting control and static switching relays. This series is designed to enable easier thermal management and higher surge handing capability. Alternistor TRIAC operates in quadrants I, II, & III and offers high performance in applications requiring high commutation capability.

### Features & Benefits

- High TJ of 150°C
- Voltage capability up to 600V
- Surge capability of 200A at 60Hz half cycle
- Mechanically and thermally robust TO-220
- Internally-isolated TO-220 and TO-218 packages
- Halogen-free and RoHS-compliant
- Recognized to UL 1557 for 2500 V<sub>RMS</sub> as an Electrically Isolated Semiconductor Devices

### Main Features

Symbol	Value	Unit
$I_{T(RMS)}$	16	A
$V_{DRM}/V_{RRM}$	400, 600, or 800	V
$I_{GT(Q1)}$	10 to 80	mA

### Applications

TRIAC is an excellent AC switch in applications such as heating, lighting, and motor speed controls.

Typical applications are

- Heater control such as coffee brewer, tankless water heater and infrared heater
- AC solid-state relays
- Light dimmers including incandescent and LED lighting
- Motor speed control in kitchen appliances, power tools, home/brow/white goods and light industrial applications as compressor motor control

Alternistor TRIAC is used with high inductive loads requiring the high commutation capability. Internally isolated packages offer better heat sinking with higher isolation voltage.

### Design Considerations

Careful selection of the correct component for the application's operating parameters and environment will go a long way toward extending the operating life of the Thyristor. Good design practice should limit the maximum continuous current through the main terminals to 75% of the component rating. Other ways to ensure long life for a power discrete semiconductor are proper heat sinking and selection of voltage ratings for worst case conditions. Overheating, overvoltage (including dv/dt), and surge currents are the main killers of semiconductors. Correct mounting, soldering, and forming of the leads also help protect against component damage.
