**Disclaimer**

Specifications are subject to change without notice. Littelfuse Startco is not liable for contingent or consequential damages, or for expenses sustained as a result of incorrect application, incorrect adjustment, or a malfunction.
This page intentionally left blank.
1. GENERAL

The SE-134C is a microprocessor-based, combination ground-fault and ground-wire monitor for resistance-grounded systems. It has a switching power supply that accepts a wide range of ac and dc voltages, and its specifications apply over an industrial temperature range at high humidity. The SE-134C meets the IEEE surge-stand-capability tests (oscillatory and fast transient) for protective relays and relay systems. Isolated, normally open and normally closed contacts are provided for controller control or for shunt or undervoltage operation in a breaker-trip circuit. All operating conditions are clearly annunciated and two Form C contacts are provided for remote indication. The SE-134C is housed in an anodized extruded-aluminum enclosure, and all connections are made with plug-in, wire-clamping terminal blocks. Provision is made for both panel and surface mounting.

The ground-fault circuit detects fundamental-frequency, zero-sequence current with a window-type current sensor and it verifies that the current sensor is connected and not shorted. A definite-time characteristic with 11 trip levels and 11 trip times allows coordination in virtually any resistance-grounded system. Although other current sensors may satisfy the verification circuit, only SE-CS10-series sensors have characteristics that meet system specifications. Current-sensor verification can be disabled for a ground-check-only application.

The ground-check circuit has an open-circuit voltage of 24 Vdc, which is not a hazard to personnel, and it has an output drive current above 100 mA for optimum performance in slip-ring, commutated-load, and high-induced-ac applications. Features include an externally accessible ground-check fuse, a resistance-insertion test, 3-kV isolation between the ground-check loop and the monitor electronics, and a PPI-600V accessory for parallel-ground-path rejection. A PPI-600V will also eliminate intermachine arcing and prevent stray ac and dc currents from flowing in the monitored ground wire. Unlike ground-check circuits using other termination devices, and especially those with phase-reversal switches, a ground-check circuit using a termination device with a Zener characteristic is capable of loop measurements that are independent of current in the phase conductors. The SE-134C ground-check circuit recognizes the SE-TA6A-series 5.6 volt Zener characteristic as a valid end-of-line completion. This is the only passive characteristic that will satisfy the ground-check circuit’s multi-level drive, allow induced currents to circulate in the ground-check loop, survive a phase-to-ground-check fault, and clamp the ground-check voltage during the fault. Although a standard 5.6 volt Zener diode may engage the SE-134C’s ground-check circuit, only an SE-TA6A-series termination assembly has the compensation required to meet system specifications. In select applications, a combination of an SE-TA12A and SE-TA12B Termination Assembly can be used to monitor the cables of a splitter box (junction box) using a single SE-134C Monitor. The SE-TA12A/SE-TA12B combination is not compatible with the SE-134C-XGC-X0 ordering option. See Technical Note GC-09, available at www.littelfuse.com/relayscontrols.

2. OPERATION

2.1 GROUND-FAULT CIRCUIT

2.1.1 GF TRIP TIME SETTING

The ground-fault circuit has a definite-time characteristic with 11 settings from 0.1 to 2.5 seconds. Time-coordinated ground-fault protection requires the trip time to be longer than the trip time of downstream ground-fault devices.

2.1.2 GF TRIP LEVEL SETTING

The trip level of the ground-fault circuit is switch selectable with 11 settings from 0.5 to 12.5 A. A minimum tripping ratio of 5 is recommended to achieve at least 80% winding protection, and this requires the trip level to be no more than 20% of the grounding-resistor let-through current. A ground-fault trip is latched, requiring a reset. A current-sensor failure will also cause a ground-fault trip. See Section 3.1

If the SE-134C is operated in a ground-check-only application and an SE-CS10 is not connected, connect terminals 17 and 18 to disable sensor verification. See Fig. 1.

2.2 GROUND-CHECK CIRCUIT

The ground-check loop consists of the outgoing ground-check conductor, quick-coupler connections, the SE-TA6A-series termination assembly, the SE-TA6A connection to equipment frame or ground bus, the ground-return path, and the SE-134C cable-ground-terminal connection to substation ground.

The SE-134C detects a valid ground-check loop when an SE-TA6A-series termination assembly is detected in the loop and loop resistance is less than 28 ohms (45 ohms for XGC option). The loop is not valid if open (or high resistance), or if the ground-check conductor is shorted to ground.

When the ground-check loop is valid, the SE-134C ground-check circuit can be tested by pressing the GC TEST button or by shorting GC TEST terminals 11 and 12. This test invalidates the loop by inserting 47 ohms (75 ohms for XGC option) in the ground-check loop and a trip should occur in less than 250 ms.

The ground-check circuit is usually operated in the non-latching mode; however, it can be operated in the latching mode by connecting terminals 14 and 15.

The ground-check circuit is protected by a 1.5-A time-delay fuse (F1).
If the SE-134C is used in a ground-fault-only application, an SE-TA6A must be connected to the ground-check and cable-ground terminals to validate the ground-check circuit. See Fig. 1.

The typical maximum distance of a trailing cable is 5.0 km (3.1 miles) for the standard model and up to 10 km (6.3 miles) for the XGC option. Several factors may limit the maximum distance of the cable, including the ground-check wire gauge, and induced ac current in the ground-check loop.

2.3 RESET

All ground-fault trips are latching and ground-check trips can be latching or non-latching. To reset ground-fault trips or latching ground-check trips, press the RESET button or connect the RESET terminals 9 and 10. See Fig. 1.

Cycling the supply voltage will also reset ground-fault trips; however, if the ground-check circuit is configured for latching fail-safe operation, the ground-check circuit will trip when supply voltage is applied.

The single-shot reset circuit responds only to a momentary closure; a jammed or shorted button will not maintain a reset signal. The front-panel RESET button is inoperative when remote-reset terminals 9 and 10 are connected. See Section 4.5.

2.4 TRIP RELAY

Isolated, normally open (Trip A, terminals 24 and 25) and normally closed (Trip B, terminals 22 and 23) contacts are provided for use in a contactor- or breaker-control circuit. With no connection between terminals 12 and 13, the SE-134C trip relay operates in the fail-safe mode. This mode is used with undervoltage devices where the trip relay energizes and its normally open contact closes if the ground-fault and ground-check circuits are not tripped. This mode is recommended because:

- Undervoltage devices release if supply voltage fails.
- Undervoltage ground-check circuits do not allow the power circuit and open cable couplers to be energized until the ground-check loop is verified.

The fail-safe mode of operation of the SE-134C trip relay can be used for shunt-trip circuits with a stored-energy trip source. In this case, the normally closed trip contact is used—the contact opens when the SE-134C is energized and the ground-fault and ground-check circuits are not tripped. Care must be taken to ensure safe and correct operation during power up and power down.

Connect terminals 12 and 13 for non-fail-safe trip relay operation with shunt-trip devices. In this mode, the normally open trip contact is used—the trip contact is closed when a ground-fault or ground-check trip occurs.

Shunt-trip circuits are not fail-safe and are not recommended because:

- Shunt-trip devices do not operate if supply voltage fails.
- Shunt-trip ground-check circuits allow the power circuit and open cable couplers to be energized for a short interval after supply voltage is applied.

**CAUTION:** The SE-134C is not a lock-out device. Follow lock-out procedures for maintenance.

3. INDICATION

3.1 GROUND FAULT

A red TRIP LED indicates a ground-fault trip and the remote-indication relay GF is energized when the ground-fault circuit is not tripped (fail-safe indication-contact operation). A green SENSOR LED indicates a current sensor is correctly connected. If the SE-CS10-series current sensor is disconnected or shorted, the green LED will go out and the ground-fault circuit will trip. If the sensor fault is intermittent, the ground-fault circuit will trip and the green LED will flash to indicate that the trip was initiated by a sensor fault.

3.2 POWER

The green POWER LED indicates that the internal power supply is on.

3.3 DIAGNOSTIC ERROR

The red DIAGNOSTIC ERROR LED indicates that an internal error caused the SE-134C to trip. Return the SE-134C to the factory if a reset does not clear the trip.

Induced ac current in the ground-check loop can cause the LED to flicker. This is a normal condition and does not indicate a diagnostic error; the ground-check monitoring circuit is not affected.

3.4 GROUND CHECK

A red TRIP LED indicates a ground-check trip. A green VALID LED indicates a valid ground-check loop and the remote-indication relay GC is energized when the ground-check loop is valid (fail-safe indication-contact operation). Two yellow LED’s indicate the status of an invalid ground-check loop. OPEN indicates the loop resistance exceeds the trip resistance and SHORT indicates the ground-check conductor is shorted to the ground conductor. A flashing yellow LED indicates the corrected cause of a latched ground-check trip.

4. INSTALLATION

4.1 GENERAL

This ground-fault ground-check monitoring system consists of an SE-134C Monitor, an SE-CS10-series Current Sensor, and an SE-TA6A-series Termination
Assembly connected as shown in Fig. 1. Select applications can use a combination of SE-TA12A and SE-TA12B Termination Assemblies (not compatible with the XGC option). See Technical Note GC-09. If required, remote indication and reset can be implemented with standard pilot devices, or with an RK-132 Remote-Indication-and-Reset Kit.

4.2 MONITOR
Each SE-134C is packaged with both panel- and surface-mounting hardware.

Outline and panel-cutout dimensions for the SE-134C are shown in Fig. 2. To panel mount the SE-134C, insert it through the panel cutout and secure it with the four supplied 8-32 locknuts and flat washers.

If an optional SE-IP65CV-R-G is used, follow the included installation instructions. See Figs. 4 and 5.

All connections to the SE-134C are made through plug-in, wire-clamping terminal blocks for 24 to 12 AWG (0.2 to 2.5 mm²) conductors. Each plug-in terminal block can be secured to the monitor by two captive screws for reliable connections in high-vibration applications.

Outline dimensions and mounting details for surface mounting an SE-134C are shown in Fig. 3. Fasten the SE-134-SMA Surface-Mount Adapter to the mounting surface and make connections to the adapter terminal blocks. Follow the instructions in Fig. 3 to install or remove the SE-134C.

Use terminal 1 (L1) as the line terminal on ac systems or the positive terminal on dc systems. Use terminal 2 (L2/N) as the neutral terminal on ac systems or the negative terminal on dc systems.

4.3 CURRENT SENSORS
Outline dimensions and mounting details for the SE-CS10-series current sensors are shown in Fig. 6. Pass only phase conductors through the sensor window as shown in Fig. 1. If a shield, ground, or ground-check conductor enters the sensor window, it must be returned through the window before it is terminated. Connect the current sensor to terminals 16 and 17. Ground terminal 17. Current-sensor primary and secondary connections are not polarity sensitive. See Section 4.7.

4.4 TERMINATION ASSEMBLY
Outline dimensions and mounting details for the SE-TA6A, SE-TA6A-WL, and SE-TA6ASF-WL are shown in Figs. 7 and 8. Install the SE-TA6A at the load to complete the ground-check loop as shown in Fig. 1. Connect terminal G of the SE-TA6A to the equipment frame so that the ground-conductor-to-equipment-frame connection will be included in the monitored loop.

4.5 REMOTE OPERATION
Remote indication contacts and a reset input are provided, as shown in Fig. 1.

The optional RK-132 Remote Kit is shown in Fig. 9. Connect terminals of the green ground-check indicator to SE-134C terminals 26 and 27 and the red ground-fault indicator to terminals 19 and 21. For remote reset, connect the normally open push-button switch across terminals 9 and 10.

4.6 PARALLEL-PATH ISOLATION
A PPI-600V can be used for parallel-path rejection. A PPI-600V will also eliminate inter-machine arcing and prevent stray ac and dc currents from flowing in the monitored ground wire. See Figs. 10 and 11. See Technical Note GC-10 “Parallel Path Isolator” at www.littelfuse.com/relayscontrols, or contact Littelfuse Startco for application details.

4.7 FERRITE PLACEMENT
A ferrite kit is included with CE-compliant options only. Where CE compliance is desired, install each ferrite as shown in Fig. 12. If a current sensor is used, connect the shield wire as shown in Fig. 13.
FIGURE 1. SE-134C Typical Application.

NOTES:

1. RELAY CONTACTS SHOWN WITH SE-134C DE-ENERGIZED.

2. TERMINALS 3/4, 5/6 AND 7/8 ARE INTERNALLY CONNECTED.

3. EXTERNAL LIGHTS AND SWITCHES NOT INCLUDED WITH SE-134C. OPTIONAL RK-132 REMOTE INDICATION AND RESET KIT AVAILABLE. SEE FIG. 9 AND ORDERING INFORMATION FOR DETAILS.
FIGURE 2. SE-134C Outline and Panel-Mounting Details.
FIGURE 3. SE-134-SMA Surface Mount Adapter and SE-134C Surface-Mounting Details.
FIGURE 4. SE-IP65CVR-G Weatherproof Cover Outline.

NOTES:
1. DIMENSIONS SHOWN IN MILLIMETRES (INCHES).
2. SHOWN WITH WEATHERPROOF SNAPS CLOSED.
3. REFER TO PANEL MOUNTING CUTOUT (FIGURE 2) FOR PANEL MOUNTING DETAIL.

TO PREVENT UNAUTHORIZED ENTRY:
1. USE WIRE SEAL THROUGH HOLES IN WEATHERPROOF COVER ASSEMBLY, OR
2. SECURE WITH THE PLASTIC THREAD FORMING SCREW SUPPLIED IN KIT.
FIGURE 5. SE-IP65CVR-G Weatherproof Cover Installation.

- Install O-ring into groove in the rear of weatherproof window.
- Insert the SE-134C through opening of the weatherproof window, until it is securely nested to the back of the dark grey PVC panel.
- Insert O-ring into the groove in the rear of weatherproof window assembly.
- Insert assembly into panel and fasten with the hardware provided with the SE-134C.
FIGURE 6. SE-CS10 Current Sensors.

NOTES:
1. DIMENSIONS SAME AS SE-TA6A.
2. WIRE LEADS #14 AWG (2.08 mm²).
3. CAN BE IMMERSED IN GLYCOL.

FIGURE 9. RK-132 Remote Indication and Reset Kit.
FIGURE 10. PPI-600V Parallel-Path Isolator.
NOTES:

1. THE PARALLEL PATH ISOLATOR IS NOT POLARIZED. EITHER FLANGE CAN BE CONNECTED TO CHASSIS.

2. THE OUTGOING GROUND MUST BE ISOLATED FROM THE CHASSIS GROUND BUS.
   IF A FLANGE-MOUNTED RECEPTACLE IS USED, VERIFY THAT THE FLANGE IS ISOLATED FROM THE GROUND PIN, AND
   - USE A MATING PLUG WITH A NON-METALLIC HOUSING, OR
   - ISOLATE THE FLANGE FROM THE CHASSIS IF THE MATING PLUG HAS A METALLIC HOUSING.

3. CABLE PLUGS AND RECEPTACLES WITH GROUNDED METAL HOUSING MUST BE ISOLATED FROM GROUND TO PREVENT PARALLEL GROUND PATHS.

4. FOR SYSTEMS ABOVE 600 VAC, CONNECT A V131DA40 MOV ACROSS THE PPI-600V.

FIGURE 11. PPI-600V Typical Installation.
NOTES:

1. PASS WIRES FROM TERMINALS 9 TO 15 THROUGH A FERRITE.

2. PASS THE SHIELDED CABLE FROM TERMINALS 16 TO 17 THROUGH A FERRITE. CONNECT THE SHIELD TO CHASSIS AS SHOWN IN FIG. 13.

3. DOUBLE LOOP THE WIRES FROM TERMINALS 19 TO 28 THROUGH A FERRITE.

4. PASS WIRES FROM FERRITE (NOTE 3) THROUGH A SECOND FERRITE.

5. ALL FERRITES ARE LAIRD TECHNOLOGIES 28A2024-0A2 AND ARE ROHS COMPLIANT.

FIGURE 12. SE-134C with Ferrites Installed.

5. TECHNICAL SPECIFICATIONS

5.1 SE-134C
Supply:
Option 0 ......................................... 25 VA, 120-240 Vac
(+10, -45%), 50-400 Hz;
15 W, 110-250 Vdc
(+10, -25%)
Option 1 ......................................... 15 W, 24-48 Vdc
(+50, -25%);
20 VA, 48 Vac
(+10, -55%), 50-100 Hz

Ground-Fault Circuit:
Digital Filter .................................. 50 to 60 Hz, Bandpass
3 dB Frequency Response ...30 to 90 Hz
Trip-Level Settings ....................... 5, 7.5, 10, 15, 20, 25,
30, 50, 75, 100, and
12.5 A
Trip-Time Settings ......................... 10, 20, 30, 40, 50, 70,
1.0, 1.3, 1.6, 2.0, and
2.5 s
Thermal Withstand ....................... 150 A Continuous
1,000 A for 2.5 s
Trip Mode ................................. Latching

Ground-Check Circuit:
Open-Circuit Voltage ............ 24 Vdc
Output Impedance ............... 136 Ω
Loop Current ....................... 105 mA
Induced-ac Withstand ........... 60 Vac Continuous,
120 Vac for 10 s,
250 Vac for 0.25 s
Pull-in Time ....................... ≤ 750 ms
Trip Resistance:
Standard ......................... 28 Ω ± 10%
XGC Option ....................... 45 Ω ± 10%
Trip Time:
Standard at 50 Ω .................. 220 ± 30 ms
XGC Option at 75 Ω ................ 220 ± 30 ms
Short Detection ................. Yes
Isolation .......................... 3 kV, 60 Hz, 1 s
Test .................................. Front-Panel Button and
Remote, N.O. Contact
Fuse Rating (F1) ....................... 1.5 A, 500 Vac,
Time Delay
Fuse Part Number ............ FNQ 1/2 Buss Fusetron
Trip Mode ......................... Latching or
Non-Latching

Trip Relay:
CSA/UL Contact Rating .... 8 A Resistive 250 Vac,
5 A 30 Vdc, 0.25 HP,
B300 Pilot Duty

Supplemental Contact Ratings:
Make/Carry (0.2 s) .............. 30 A
Break dc ....................... 75 W Resistive,
35 W Inductive (L/R < 0.04)
Break ac ....................... 2,000 VA Resistive,
1,500 VA Inductive
(PF > 0.4)
Subject to maximums of 8 A and 250 V (ac or dc)
Contact Configuration ........... Isolated N.O. and
N.C. Contacts
Operating Mode ................. Fail-Safe or
Non-Fail-Safe
Maximum Switching
Capacity .......................... Fig.14

Remote-Indication Relays:
CSA/UL Contact Rating .... 8 A Resistive 250 Vac,
8 A 30 Vdc
Supplemental Contact Ratings:
Make/Carry (0.2 s) .............. 20 A
Break dc ....................... 50 W Resistive,
25 W Inductive (L/R < 0.04)
Break ac ....................... 2,000 VA Resistive,
1,500 VA Inductive
(PF > 0.4)
Subject to maximums of 8 A and 250 V (ac or dc)
Contact Configuration ........... N.O and N.C. (Form C)
Operating Mode ................. Fail-Safe
Maximum Switching
Capacity .......................... Fig.15

Trip Reset .......................... Front-Panel Button and
Remote, N.O. Contact

Terminal Block Rating .......... 10 A, 300 Vac,
12 AWG (2.5 mm²)
PWB Conformal Coating .......... MIL-1-46058 qualified,
UL QMJU2 recognized

Mounting Configuration ........ Panel Mount and
Surface Mount

Dimensions:
Height ................................ 213 mm (8.4”)
Width ................................ 99 mm (3.9”)
Depth ................................ 132 mm (5.2”)

Shipping Weight ................. 2.3 kg (5.1 lb)

Environment:
Operating Temperature ...... -40 to 60°C (-40 to 140°F)
Storage Temperature ........ -55 to 80°C (-67 to 176°F)
Humidity ..................... 85% Non-Condensing
IP Rating ....................... IP40 when panel-mounted, IP20 otherwise
Surge Withstand ............... ANSI/IEEE 37.90.1-2002
(Oscillatory and Fast Transient)
EMC Tests:
Verification tested in accordance with EN 60255-26:2009.

Radiated and Conducted
Emissions ..................CISPR 22:2008-09
Class A

Current Harmonics and
Voltage Fluctuations ........IEC 61000-3-2
and IEC 61000-3-3
Class A

Electrostatic Discharge ......IEC 61000-4-2
± 6 kV contact discharge
(direct and indirect)
± 8 kV air discharge

Radiated RF Immunity ......IEC 61000-4-3
10 V/m, 80-1,000 MHz,
80% AM (1 kHz)
10 V/m, 1.0 to 2.7 GHz,
80% AM (1 kHz)

Fast Transient ..............IEC 61000-4-4
Class A: ± 4 kV (on AC
mains and I/O lines)

Surge Immunity .............IEC 61000-4-5
Zone B
± 1 kV differential mode
± 2 kV common mode

Conducted RF Immunity .....IEC 61000-4-6
10 V, 0.15-80 MHz,
80% AM (1 kHz)

Magnetic Field
Immunity ...................IEC 61000-4-8
50 Hz and 60 Hz
30 A/m and 300 A/m

Power Frequency ............IEC 60255-22-7
Zone A: differential mode
150 Vrms
Zone A: common mode
300 Vrms

1 MHz Burst .................IEC 61000-4-18
± 1 kV differential mode
(line-to-line)
± 2.5 kV common mode

Certification ..................CSA, Canada and USA

(2) CE/RCM not available.

**Ground-Check Termination:**

SE-TA6A...............50-W Termination Assembly with Screw Terminals

SE-TA6A-WL..........50-W Termination Assembly with Wire Leads

SE-TA6ASF-WL........12-W Small-Format Termination Assembly with Wire Leads

**Current Sensors:**

SE-CS10-2.5 ...........Current Sensor, 63 mm (2.5") window

SE-CS10-4 ............Current Sensor, 108 mm (4.2") window

SE-CS10-6 ............Current Sensor, 160 mm (6.3") window

SE-CS10-8 ............Current Sensor, 209 mm (8.2") window

**Parallel Path Isolator:**

PPI-600V ...............For system voltages up to 600 Vac

**Certification**

- CE(1), European Union
- IEC 60044-1
- RoHS Pending

**Compliance**

- CSA, Canada and USA
- CE(1), European Union

- UL Listed
- CUL 5342
- CE(1), European Union

**NOTES:**

(1) When connected to an SE-134C.
Accessories:

RK-132........................Remote Indication and
Reset Kit, includes two
24-120-V pilot lights, a
reset push button, and
legend plates

SE-IP65CVR-G................Hinged transparent cover,
IP65

SE-134-SMA..................Surface-Mount Adapter,
included with SE-134C

SE-134-HDWR ...............Hardware Kit
(excludes ferrites and
SE-134-SMA), included
with SE-134C

7. WARRANTY

The SE-134C Ground-Fault Ground-Check Monitor is
warranted to be free from defects in material and
workmanship for a period of five years from the date of
purchase.

Littelfuse Startco will (at Littelfuse Startco’s option)
repair, replace, or refund the original purchase price of an
SE-134C that is determined by Littelfuse Startco to be
defective if it is returned to the factory, freight prepaid,
within the warranty period. This warranty does not apply
to repairs required as a result of misuse, negligence, an
accident, improper installation, tampering, or insufficient
care. Littelfuse Startco does not warrant products
repaired or modified by non-Littelfuse Startco personnel.

8. TEST PROCEDURES

8.1 GROUND-CHECK TRIP TESTS

8.1.1 LATCHING GROUND-CHECK TRIP TEST

Connect the monitor, current sensor and termination
assembly as shown in Fig 16. Connect terminals 14 and
15 for latching operation. With supply voltage applied,
the POWER, SENSOR, and VALID LED’s will be on.

Open the ground-check loop by removing either the
GC or G connection between the monitor and the
termination assembly (pressing the faceplate GC TEST
button will also perform an open circuit test). The
monitor will trip. The trip contacts (terminals 22-23
and 24-25) and the ground-check indication contacts
(terminals 26-27 and 26-28) will change state. The
VALID LED will be off, and both the GROUND CHECK
TRIP and the OPEN LED’s will be on.

Reconnect the ground-check loop. The monitor will
reset. The VALID and
TRIP LED’s will be on and the OPEN LED will be
flashing. The TRIP contacts (terminals 22-23 and 24-25)
will remain latched and ground-check indication contacts
(terminals 26-27 and 26-28) will change state.

Reset the monitor.

8.1.2 NON-LATCHING GROUND-CHECK TRIP TEST

Connect the monitor, current sensor and termination
device as shown in Fig. 16. With supply voltage applied,
the POWER, SENSOR, and VALID LED’s will be on.

Open the ground-check loop by removing either the
GC or G connection between the monitor and the
termination assembly (pressing the faceplate GC Test
button will also perform an open circuit test). The
monitor will trip. The trip contacts (terminals 22-23
and 24-25) and the ground-check indication contacts
(terminals 26-27 and 26-28) will change state. The
VALID LED will be off, and both the GROUND CHECK
TRIP and the OPEN LED’s will be on.

Reconnect the ground-check loop. The monitor will
reset. Short the ground-check loop by connecting G to GC.
The monitor will trip. The trip contacts (terminals 22-23
and 24-25) and the ground-check indication contacts
(terminals 26-27 and 26-28) will change state. The
VALID LED will be off, and both the GROUND CHECK
TRIP and the SHORT LED’s will be on.

Remove the short from G to GC. The VALID and
TRIP LED’s will be on and the SHORT LED will be
flashing. The TRIP contacts (terminals 22-23 and 24-25)
will remain latched and ground-check indication contacts
(terminals 26-27 and 26-28) will change state.

Reset the monitor.

8.2 TRIP RELAY FAIL-SAFE MODE TEST

Connect the monitor, current sensor and termination
device as shown in Fig. 16. With supply voltage applied,
the POWER, SENSOR, and VALID LED’s will be on.
The output contacts between terminals 22 and 23 will be
closed and between 24 and 25 will be open.

Remove the supply voltage. The output contacts
between terminals 22 and 23 will close and the output
contacts between terminals 24 and 25 will open.

8.3 CURRENT-SENSOR-VERIFICATION TEST

Connect the monitor, current sensor and termination
device as shown in Fig. 16. With supply voltage applied,
the POWER, SENSOR, and VALID LED’s will be on.

Open the current-sensor circuit by disconnecting one of
the sensor leads. The monitor will trip. The trip contacts
(terminals 22-23 and 24-25) and the ground-fault
indication contacts (terminals 19-20 and 19-21) will
change state. The GROUND FAULT TRIP LED will be
on and the SENSOR LED will be off.
Reconnect the current sensor. The GROUND FAULT TRIP LED will stay on and the SENSOR LED will flash. The output contacts will remain latched.

Reset the monitor.

Short the current sensor by connecting terminals 16 and 17. The monitor will trip. The trip contacts (terminals 22-23 and 24-25) and the ground-fault indication contacts (terminals 19-20 and 19-21) will change state. The GROUND FAULT TRIP LED will be on and the SENSOR LED will be off.

Remove the short from terminals 16 and 17. The GROUND FAULT TRIP LED will stay on and the SENSOR LED will flash. The output contacts will remain latched.

Reset the monitor.

8.4 SE-TA6A-SERIES TERMINATION ASSEMBLY TESTS

Apply 15 Vdc across the series combination of a 100-Ω, 5-W current-limiting resistor and the termination assembly, as shown in Fig. 17. In the reverse biased test, the voltage should be 5.6 V across the termination assembly terminals. In the forward biased test, the voltage across the termination assembly terminals should be between 0.3 and 0.9 V.

8.5 GROUND-FAULT PERFORMANCE TEST

To meet the requirements of the National Electrical Code (NEC), as applicable, the overall ground-fault protection system requires a performance test when first installed. A written record of the performance test is to be retained by those in charge of the electrical installation in order to make it available to the authority having jurisdiction. A test-record form is provided for recording the date and the final results of the performance tests. The following ground-fault system tests are to be conducted by qualified personnel:

a) Evaluate the interconnected system in accordance with the overall equipment manufacturer’s detailed instructions.

b) Verify proper location of the ground-fault current sensor. Ensure the cables pass through the ground-fault-current-sensor window. This check can be done visually with knowledge of the circuit. The connection of the current-sensor secondary to the SE-134C is not polarity sensitive.

c) Verify that the system is correctly grounded and that alternate ground paths do not exist that bypass the current sensor. High-voltage testers and resistance bridges can be used to determine the existence of alternate ground paths.

d) Verify proper reaction of the circuit-interrupting device in response to a simulated or controlled ground-fault current. To simulate ground-fault current, use CT-primary current injection. Fig. 14 shows a test circuit using Littelfuse Startco Ground-Fault-Relay Test Units. The SE-400 has a programmable output of 0.5 to 9.9 A for a duration of 0.1 to 9.9 seconds. Set the test current to 120% of GF TRIP LEVEL. The SE-100T provides a test current of 0.65 or 2.75 A for testing 0.5- and 2.0-A trip levels. Inject the test current through the current-sensor window for at least 2.5 seconds. Verify that the circuit under test has reacted properly. Correct any problems and re-test until the proper reaction is verified.

e) Record the date and the results of the test on the attached test-record form.

TABLE 1. GROUND-FAULT-TEST RECORD

<table>

MANUAL REVISION HISTORY

REVISION 7-D-090816

SECTION 2
XGC compatibility notes added.

SECTION 5
Added Figs. 14 and 15.
RCM Certification added.

SECTION 6
RCM Certification added.

REVISION 7-C-100114

SECTION 4
Figs. 7, 8, and 11 updated.

REVISION 7-B-111213

SECTION 2
Maximum trailing cable length added.

SECTION 5
Additional termination assembly and compliance specifications added.

REVISION 7-A-050613

SECTION 4
Ferrite placement instructions added.

SECTION 5
CE specifications, XGC option, and dimensions added.

SECTION 6
Ordering information updated.

PRODUCT REVISION HISTORY

REVISION 05D
Ferrite kit added.
